

Thinking Like a PM at Whatfix

A product teardown on building a more adaptive adoption loop

Rohitha Srija

The question I wanted to answer

What happens after you discover where users struggle?

- Enterprise software constantly changes.
- User friction changes with it.
- The opportunity may be to make the adoption loop more adaptive.

My hypothesis → Detect → Diagnose → Intervene → Measure → Adapt

The Problem

Enterprise software doesn't stand still.

The challenge isn't only adoption. It's continuous adaptation.

The Problem

Whatfix already has the pieces.

The interesting part isn't each product.
It's what happens when they work
together.

MIRROR

**Practice before
production**

Simulate
workflows
Build confidence

DAP

**Guide in the
flow of work**

Contextual
guidance
Inside the
application

PRODUCT

ANALYTICS

**Understand user
behavior**

Find friction
Identify
opportunities

AI

Understand +
assist
Context + intent
Insights +
support

Then I asked one question..

What happens when the software changes?

Someone has to notice. Diagnose. Fix. Measure.

APPLICATION CHANGES

USER BEHAVIOR CHANGES

FRICTION APPEARS

GUIDANCE NEEDS TO ADAPT

What I found in customer feedback

The user experience can be simple while the system behind it remains complex.

EASY TO USE

Customers value contextual guidance and no-code content creation

ENTERPRISE COMPLEXITY

Reviews mention setup, administration and the learning curve.

ONGOING MAINTENANCE

Keeping experiences aligned with changing applications can require ongoing effort.

Sources: G2 customer reviews • Gartner Peer Insights

So I asked myself one more question.

What if adoption could adapt itself?

Whatfix already helps customers understand and influence user behavior.

I wanted to explore what happens when that loop becomes continuous.

My hypothesis

What if adoption could adapt itself?

Whatfix already helps teams identify friction and guide users.

I'd explore closing the loop between insight and action.

01 — DETECT

Find friction

02 — DIAGNOSE

Understand why

03 — RECOMMEND

Suggest an intervention

04 — TEST

Validate with users

05 — MEASURE

Did behavior change?

06 — ADAPT

Keep • Change • Remove

A SIMPLE EXAMPLE

What could this look like?

A hypothetical scenario showing how a friction signal could become a tested intervention.

VALIDATING THE HYPOTHESIS

**I wouldn't build
it first.
I'd test it.**

**The goal: prove that a targeted
intervention actually improves
the workflow outcome.**

Same workflow → Different intervention → Compare outcome

Start with one workflow. Prove the impact before scaling.

CONTROL

**Existing
experience**

Users complete the
workflow
with the current
experience.

No new
intervention.

TREATMENT

**Targeted
intervention**

Users receive
contextual
guidance
at the identified
friction point.

WHAT I'D MEASURE

PRIMARY

Workflow completion rate

SECONDARY

Time to complete · Error rate · Help searches

GUARDRAIL

Intervention dismissal

IF THE HYPOTHESIS HOLDS

From reactive adoption support to continuous improvement.

Instead of optimizing guidance once, Whatfix could help teams learn which interventions actually move user behavior.

1

BETTER USER OUTCOMES

Less friction. More successful workflows.

Users get help where it actually matters.

2

SMARTER ADMIN DECISIONS

Less guesswork. Better prioritization.

Teams know which interventions are worth keeping.

3

A LEARNING PRODUCT

Every intervention creates a feedback signal.

What works becomes a stronger starting point for the next workflow.

The goal isn't more guidance. It's better guidance, proven by outcomes.
